

# RB-SFA: High Harmonic Generation in the Strong Field Approximation via *Mathematica*

© Emilio Pisanty 2014-2016. Licensed under GPL and CC-BY-SA.

## ■ Introduction

### Readme

RB-SFA is a compact and flexible *Mathematica* package for calculating High Harmonic Generation emission within the Strong Field Approximation. It combines *Mathematica*'s analytical integration capabilities with its numerical calculation capacities to offer a fast and user-friendly plug-and-play solver for calculating harmonic spectra and other properties. In addition, it can calculate first-order nondipole corrections to the SFA results to evaluate the effect of the driving laser's magnetic field on harmonic spectra.

The name RB-SFA comes from its first application (as Rotating Bicircular High Harmonic Generation in the Strong field Approximation) but the code is general so RB-SFA just stands for itself now. This first application was used to calculate the polarization properties of the harmonics produced by multi-colour circularly polarized fields, as reported in the paper

Spin conservation in high-order-harmonic generation using bicircular fields. E. Pisanty, S. Sukiasyan and M. Ivanov. *Phys. Rev. A* **90**, 043829 (2014), arXiv:1404.6242.

This code is dual-licensed under the GPL and CC-BY-SA licenses. If you use this code or its results in an academic publication, please cite the paper above or the GitHub repository where the latest version will always be available. An example citation is

E. Pisanty. RB-SFA: High Harmonic Generation in the Strong Field Approximation via *Mathematica*. <https://github.com/episanty/RB-SFA> (2016).

This software consists of this notebook, which contains the code and its documentation, a corresponding auto-generated package file. This notebook also contains a Usage and Examples section which explains how to use the code and documents the calculations used in the original publication.

## ■ Implementation

---

## Supporting functions

### Initialization

```
BeginPackage["RBSFA`"];
```

## Version number

The command `RBSFAversion` prints the version of the RB-SFA package currently loaded and its timestamp

```
$RBSFAversion::usage = "$RBSFAversion prints the
  current version of the RB-SFA package in use and its timestamp.";
RBSFAtimestamp::usage = "$RBSFAtimestamp prints the timestamp of
  the current version of the RB-SFA package.";
Begin["`Private`"];
RBSFAversion := "RB-SFA v2.1.3, "<> RBSFAtimestamp;
End[];
```

Old syntax (in functional form `RBSFAversion[]`), deprecated

```
RBSFAversion::usage = "RBSFAversion[] has been deprecated in favour of $RBSFAversion.";
RBSFAversion::dprc = "RBSFAversion[] has been deprecated in favour of $RBSFAversion.";
Begin["`Private`"];
RBSFAversion[] := (Message[RBSFAversion::dprc]; $RBSFAversion);
End[];
```

The timestamp is updated every time the notebook is saved via an appropriate notebook option, which is set by the code below.

```
SetOptions[
  EvaluationNotebook[],
  NotebookEventActions → {{"MenuCommand", "Save"} ⇒ (
    NotebookWrite[
      Cells[CellTags → "version-timestamp"][[1]],
      Cell[
        BoxData[RowBox[
          {"Begin[\"`Private`\"];\n$RBSFAtimestamp=\"\" <> DateString[] <> "\";\nEnd[];"}]]
        , "Input", InitializationCell → True, CellTags → "version-timestamp"
      ], None, AutoScroll → False];
    NotebookSave[]
  ), PassEventsDown → True}
];
```

To reset this behaviour to normal, evaluate the cell below

```
SetOptions[EvaluationNotebook[],
  NotebookEventActions → {{"MenuCommand", "Save"} ⇒ (NotebookSave[]), PassEventsDown → True}]
```

## Timestamp

```
Begin["`Private`"];
$RBSFAtimestamp = "Wed 14 Dec 2016 16:12:32";
End[];
```

## Directory

```
$RBSFAdirectory::usage =
  "$RBSFAdirectory is the directory where the current RB-SFA package instance is located.";
```

```
Begin["`Private`"];
With[{softLinkTestString = StringSplit[StringJoin[ReadList[
  "! ls -la " <> StringReplace[$InputFileName, {" " → "\\ "}], String]], " -> "]],
  If[Length[softLinkTestString] > 1, (*Testing in case $InputFileName
    is a soft link to the actual directory.*)
    $RBSFAdirectory = StringReplace[DirectoryName[softLinkTestString[[2]], {" " → "\\ "}],
    $RBSFAdirectory = StringReplace[DirectoryName[$InputFileName], {" " → "\\ "}],
  ]];
End[];
```

## Git commit hash and message

```
$RBSFACommit::usage = "$RBSFACommit returns the git
  commit log at the location of the RB-SFA package if there is one.";
$RBSFACommit::OS = "$RBSFACommit has only been tested on Linux.";
```

```
Begin["`Private`"];
$RBSFACommit := (If[$OperatingSystem ≠ "Unix", Message[$RBSFACommit::OS]];
  StringJoin[Riffle[ReadList["!cd " <> $RBSFAdirectory <> " && git log -1", String], {"\n"}]]];
End[];
```

## Function redefinitions

### ConstantArray

This redefines `ConstantArray` to take the corner case of an empty dimensions list, which returns an error code (and an unevaluated `ConstantArray`) for Mathematica versions under 10.1.0 (cf. [mma.se/q/133078](http://mma.se/q/133078)).

```
Quiet[Check[
  ConstantArray[0, {}];,
  Unprotect[ConstantArray];
  ConstantArray[Private`x_, {}] := Private`x;
  Protect[ConstantArray];
]];
```

Similarly, this needs to be put inside an initialization code for any parallelized subkernels that may get launched later (cf. [mm.se/q/131856](http://mm.se/q/131856)).

```
Parallelize;
Parallel`Developer`$InitCode = Hold[
  Quiet[Check[
    ConstantArray[0, {}];,
    Unprotect[ConstantArray];
    ConstantArray[Private`x_, {}] := Private`x;
    Protect[ConstantArray];
  ]];
];
```

## ReIm

This adds the definition of ReIm for those versions (<10.1) that don't have it.

```
If[
  Context[ReIm] != "System`,",
  ReIm::usage =
    "\!\(\*RowBox[{\"ReIm\", \"[\", StyleBox[\"z\", \"TI\"], \"]\"}]\)\) gives the
    list \!\(\*RowBox[{\"{\", RowBox[{RowBox[{\"Re\", \"[\", StyleBox[\"z\",
    \"TI\"], \"]\"}], \"\", RowBox[{\"Im\", \"[\", StyleBox[\"z\", \"TI\"],
    \"]\"}]}], \"]\"}]\)\) of the number \!\(\*StyleBox[\"z\", \"TI\"]\).\";
  ReIm[Private`z_] := {Re[Private`z], Im[Private`z]};
  SetAttributes[ReIm, Listable];
  Protect[ReIm];
]
```

## Dipole transition matrix elements

### Default DTME, for a hydrogenic 1s state

```

hydrogenicDTME::usage =
  "hydrogenicDTME[p,κ] returns the dipole transition matrix element for
    a 1s hydrogenic state of ionization potential  $I_p = \frac{1}{2}\kappa^2$ .

hydrogenicDTME[p,κ,{n,l,m}] returns the dipole transition matrix element for
    an n,l,m hydrogenic state of ground-state ionization potential  $I_p = \frac{1}{2}\kappa^2$ .

hydrogenicDTME[p,κ,n,l,m] returns the dipole transition matrix element for an
    n,l,m hydrogenic state of ground-state ionization potential  $I_p = \frac{1}{2}\kappa^2$ .";
hydrogenicDTMERegularized::usage = "hydrogenicDTMERegularized[p,κ] returns
    the dipole transition matrix element for a 1s hydrogenic state of
    ionization potential  $I_p = \frac{1}{2}\kappa^2$ , regularized to remove the denominator
    of  $1/(p^2 + \kappa^2)^3$ , where the saddle-point solutions are singular.

hydrogenicDTMERegularized[p,κ,{n,l,m}] returns the dipole transition matrix
    element for an n,l,m hydrogenic state of ground-state ionization potential
     $I_p = \frac{1}{2}\kappa^2$ , regularized to remove factors of  $(p^2 + \kappa^2)$  from the denominator.

hydrogenicDTMERegularized[p,κ,n,l,m] returns the dipole transition matrix
    element for an n,l,m hydrogenic state of ground-state ionization potential
     $I_p = \frac{1}{2}\kappa^2$ , regularized to remove factors of  $(p^2 + \kappa^2)$  from the denominator.";
Begin["`Private`"];
hydrogenicDTME[p_List, κ_] :=  $\frac{8 \, i}{\pi} \frac{\sqrt{2 \, \kappa^5} \, p}{(\text{Total}[p^2] + \kappa^2)^3}$ 
hydrogenicDTME[p_?NumberQ, κ_] :=  $\frac{8 \, i}{\pi} \frac{\sqrt{2 \, \kappa^5} \, p}{(p^2 + \kappa^2)^3}$ 
hydrogenicDTMERegularized[p_List, κ_] :=  $\frac{8 \, i}{\pi} \frac{\sqrt{2 \, \kappa^5} \, p}{1}$ 
hydrogenicDTMERegularized[p_?NumberQ, κ_] :=  $\frac{8 \, i}{\pi} \frac{\sqrt{2 \, \kappa^5} \, p}{1}$ 
End[];

```

## For a gaussian orbital

```

gaussianDTME::usage = "gaussianDTME[p,κ] returns the dipole transition
  matrix element for a gaussian state of characteristic size 1/κ.";
Begin["`Private`"];

gaussianDTME[p_List, κ_] := -i (4 π)3/4 κ-7/2 p Exp[- $\frac{\text{Total}[p^2]}{2 \kappa^2}$ ]

gaussianDTME[p_?NumberQ, κ_] := -i (4 π)3/4 κ-7/2 p Exp[- $\frac{p^2}{2 \kappa^2}$ ]

End[];

```

## SolidHarmonicS

This function implements the solid harmonic  $S_{l,m}(r) = r^l Y_{l,m}(\theta, \phi)$ , which is a homogeneous polynomial of degree  $l$ , and lends itself much better to symbolic differentiation than explicit spherical harmonics.

Code provided by J.M. at <http://mathematica.stackexchange.com/a/124336/1000> under the WTFPL.

```

SolidHarmonicS::usage =
  "SolidHarmonicS[l,m,x,y,z] calculates the solid harmonic  $S_{lm}(x,y,z) = r^l Y_{lm}(x,y,z)$  .

SolidHarmonicS[l,m,{x,y,z}] does the same.";
Begin["`Private`"];

SolidHarmonicS[λ_Integer, μ_Integer, x_, y_, z_] /; λ ≥ Abs[μ] :=
  Sqrt[ $\frac{2 \lambda + 1}{4 \pi}$ ] Sqrt[ $\frac{\text{Gamma}[\lambda - \text{Abs}[\mu] + 1]}{\text{Gamma}[\lambda + \text{Abs}[\mu] + 1]}$ ] 2-λ x
  If[Rationalize[μ] == 0, 1, (x + Sign[μ] i y)Abs[μ]] x
  Sum[
    (-1)Abs[μ]+k Binomial[λ, k] Binomial[2 λ - 2 k, λ] Pochhammer[λ - Abs[μ] - 2 k + 1, Abs[μ]] x
    If[Rationalize[k] == 0, 1, (x2 + y2 + z2)k] x
    If[Rationalize[λ - Abs[μ] - 2 k] == 0, 1, zλ - Abs[μ] - 2 k]
    , {k, 0, Quotient[λ, 2]}]
SolidHarmonicS[λ_Integer, μ_Integer, {x_, y_, z_}] /; λ ≥ Abs[μ] :=
  SolidHarmonicS[λ, μ, x, y, z]
End[];

```

## hydrogenicY (momentum-space wavefunctions)

This implements the dipole transition matrix element from an arbitrary hydrogenic orbital  $n, l, m$ , where the ground-state ionization potential is given by  $I_p = \frac{1}{2} \kappa^2$ , as described in Luke Chipperfield's PhD thesis (Imperial College London, 2006, p. 52). This code uses partial memoization as in [mm.se/q/21782](http://mm.se/q/21782).

```

hydrogenicΥ::usage =
  "hydrogenicΥ[n,l,m,κ,px,py,pz] calculates the momentum-space wavefunction
  Υ(p)=⟨p|nlm⟩ for a hydrogenic atom with ionization potential κ2/2.

hydrogenicΥ[n,l,m,κ,{px,py,pz}] calculates the momentum-space wavefunction
  Υ(p)=⟨p|nlm⟩ for a hydrogenic atom with ionization potential κ2/2.";
Begin["`Private`"];
hydrogenicΥ[n_, l_, m_, κ_, ppx_, ppy_, ppz_] := Block[{κ, px, py, pz},
  hydrogenicΥ[n, l, m, κ_, px_, py_, pz_] = Simplify[
    -SolidHarmonics[l, m, px, py, pz]  $\frac{(-\frac{1}{2})^l \pi 2^{2l+4} l!}{(2 \pi \kappa)^{3/2}} \sqrt{\frac{n (n-l-1)!}{(n+l)!}}$ 
     $\frac{\kappa^{l+4}}{(px^2 + py^2 + pz^2 + \kappa^2)^{l+2}}$  GegenbauerC[n-l-1, l+1,  $\frac{px^2 + py^2 + pz^2 - \kappa^2}{px^2 + py^2 + pz^2 + \kappa^2}$ ]
  ];
  hydrogenicΥ[n, l, m, κκ, ppx, ppy, ppz]
];
hydrogenicΥ[n_, l_, m_, κ_, {px_, py_, pz_}] := hydrogenicΥ[n, l, m, κ, px, py, pz];
End[];

```

Regularized version, removing the

```

hydrogenicΥRegularized::usage =
  "hydrogenicΥRegularized[n,l,m,κ,px,py,pz] calculates the momentum-space wavefunction
  Υ(p)=⟨p|nlm⟩ for a hydrogenic atom with ionization potential κ2/2,
  multiplied by (p2+κ2)n+1 to remove any factors of p2+κ2 in the denominator.

hydrogenicΥRegularized[n,l,m,κ,{px,py,pz}] calculates the momentum-space wavefunction
  Υ(p)=⟨p|nlm⟩ for a hydrogenic atom with ionization potential κ2/2,
  multiplied by (p2+κ2)n+1 to remove any factors of p2+κ2 in the denominator.";
Begin["`Private`"];
hydrogenicΥRegularized[n_, l_, m_, κ_, ppx_, ppy_, ppz_] := Block[{κ, px, py, pz},
  hydrogenicΥRegularized[n, l, m, κ_, px_, py_, pz_] = Simplify[Cancel[
    -SolidHarmonics[l, m, px, py, pz]  $\frac{(-\frac{1}{2})^l \pi 2^{2l+4} l!}{(2 \pi \kappa)^{3/2}} \sqrt{\frac{n (n-l-1)!}{(n+l)!}}$ 
     $\kappa^{l+4} (px^2 + py^2 + pz^2 + \kappa^2)^{n-l-1}$  GegenbauerC[n-l-1, l+1,  $\frac{px^2 + py^2 + pz^2 - \kappa^2}{px^2 + py^2 + pz^2 + \kappa^2}$ ]
  ]];
  hydrogenicΥRegularized[n, l, m, κκ, ppx, ppy, ppz]
];
hydrogenicΥRegularized[n_, l_, m_, κ_, {px_, py_, pz_}] :=
  hydrogenicΥRegularized[n, l, m, κ, px, py, pz];
End[];

```

## hydrogenicDTME for arbitrary states

```
Begin["`Private`"];
hydrogenicDTME[{ppx_, ppy_, ppz_}, κ_, n_, l_, m_] := Block[{κ, px, py, pz},
  hydrogenicDTME[{px_, py_, pz_}, κ_, n_, l_, m] =
    Simplify[Grad[hydrogenicY[n, l, m, κ, px, py, pz], {px, py, pz}]];
  hydrogenicDTME[{ppx, ppy, ppz}, κ, n, l, m]
];
hydrogenicDTME[{px_, py_, pz_}, κ_, {n_, l_, m_}] := hydrogenicDTME[{px, py, pz}, κ, n, l, m];
End[];
```

```
Begin["`Private`"];
hydrogenicDTMERegularized[{ppx_, ppy_, ppz_}, κ_, n_, l_, m_] := Block[{κ, px, py, pz},
  hydrogenicDTMERegularized[{px_, py_, pz_}, κ_, n_, l_, m] =
    Simplify[Grad[hydrogenicYRegularized[n, l, m, κ, px, py, pz], {px, py, pz}]];
  hydrogenicDTMERegularized[{ppx, ppy, ppz}, κ, n, l, m]
];
hydrogenicDTMERegularized[{px_, py_, pz_}, κ_, {n_, l_, m_}] :=
  hydrogenicDTMERegularized[{px, py, pz}, κ, n, l, m];
End[];
```

## Various field envelopes

### flatTopEnvelope

```
flatTopEnvelope::usage =
  "flatTopEnvelope[ω,num,nRamp] returns a Function object representing
  a flat-top envelope at carrier frequency ω lasting a total
  of num cycles and with linear ramps nRamp cycles long.";
Begin["`Private`"];
flatTopEnvelope[ω_, num_, nRamp_] := Function[t,
  Piecewise[{
    {0, t < 0}, {Sin[ $\frac{\omega t}{4 nRamp}$ ]2, 0 ≤ t <  $\frac{2\pi}{\omega} nRamp$ }, {1,  $\frac{2\pi}{\omega} nRamp \leq t < \frac{2\pi}{\omega} (num - nRamp)$ },
    {Sin[ $\frac{\omega (\frac{2\pi}{\omega} num - t)}{4 nRamp}$ ]2,  $\frac{2\pi}{\omega} (num - nRamp) \leq t < \frac{2\pi}{\omega} num$ }, {0,  $\frac{2\pi}{\omega} num \leq t$ }
  }]]
End[];
```

## cosPowerFlatTop

```
cosPowerFlatTop::usage =
  "cosPowerFlatTop[ $\omega$ ,num,power] returns a Function object representing
  a smooth flat-top envelope of the form  $1 - \cos(\omega t/2 \text{ num})^{\text{power}}$ ";
Begin["`Private`"];
cosPowerFlatTop[ $\omega$ _, num_, power_] := Function[t, 1 - Cos[ $\frac{\omega t}{2 \text{ num}}$ ]power];
End[];
```

## Field duration standard options

The standard options for the duration of the pulse and the resolution are

```
PointsPerCycle::usage =
  "PointsPerCycle is a sampling option which specifies the number of sampling
  points per cycle to be used in integrations.";
TotalCycles::usage = "TotalCycles is a sampling option which specifies
  the total number of periods to be integrated over.";
CarrierFrequency::usage = "CarrierFrequency is a sampling option
  which specifies the carrier frequency to be used.";
Protect[PointsPerCycle, TotalCycles, CarrierFrequency];
```

```
standardOptions = {PointsPerCycle → 90, TotalCycles → 1,
  CarrierFrequency → 0.057, IntegrationPointsPerCycle → Automatic};
```

PointsPerCycle dictates how many sampling points are used per laser cycle (at frequency CarrierFrequency, of the infrared laser), and it should be at least twice the highest harmonic of interest. The total duration is TotalCycles cycles. CarrierFrequency is the frequency of the fundamental laser, in atomic units.

## harmonicOrderAxis

harmonicOrderAxis produces a list that can be used as a harmonic order axis for the given pulse parameters.

The length can be fine-tuned (to match exactly a spectrum, for instance, and get a matrix of the correct shape) using the correction option, or a TargetLength can be directly specified.

```

harmonicOrderAxis::usage =
  "harmonicOrderAxis[opt→value] returns a list of frequencies which can
    be used as a frequency axis for Fourier transforms, scaled in units of
    harmonic order, for the provided field duration and sampling options.";
TargetLength::usage = "TargetLength is an option for harmonicOrderAxis
  which specifies the total length required of the resulting list.";
LengthCorrection::usage = "LengthCorrection is an option for harmonicOrderAxis
  which allows for manual correction of the length of the resulting list.";
Protect[LengthCorrection, TargetLength];
Begin["`Private`"];
Options[harmonicOrderAxis] =
  standardOptions~Join~{TargetLength→Automatic, LengthCorrection→1};
harmonicOrderAxis::target =
  "Invalid TargetLength option `1`. This must be a positive integer or Automatic.";
harmonicOrderAxis[OptionsPattern[]] :=
  Module[{num = OptionValue[TotalCycles], npp = OptionValue[PointsPerCycle]},
    Piecewise[{
      { $\frac{1}{\text{num}}$  Range[0., Round[ $\frac{\text{npp num} + 1}{2.}$ ] - 1 + OptionValue[LengthCorrection]],
        OptionValue[TargetLength] === Automatic},
      { $\frac{\text{Round}[\frac{\text{npp num} + 1}{2.}]}{\text{num}}$  Range[0, OptionValue[TargetLength] - 1],
        IntegerQ[OptionValue[TargetLength]] && OptionValue[TargetLength] ≥ 0}
    }],
    Message[harmonicOrderAxis::target, OptionValue["TargetLength"]]; Abort[]
  ]
End[];

```

## frequencyAxis

frequencyAxis produces a list that can be used as a harmonic order axis for the given pulse parameters. Identical to harmonicOrderAxis but produces a frequency axis (in atomic units) instead.

```

frequencyAxis::usage =
  "frequencyAxis[opt→value] returns a list of frequencies which can be used
    as a frequency axis for Fourier transforms, in atomic units of
    frequency, for the provided field duration and sampling options.";
Begin["`Private`"];
Options[frequencyAxis] = Options[harmonicOrderAxis];
frequencyAxis[options:OptionsPattern[]] :=
  OptionValue[CarrierFrequency] harmonicOrderAxis[options]
End[];

```

## timeAxis

timeAxis produces a list that can be used as a time axis for the given pulse parameters.

Quit

```
timeAxis::usage =
  "timeAxis[opt→value] returns a list of times which can be used as a time axis ";
TimeScale::usage = "TimeScale is an option for timeAxis which specifies the units
  the list should use: AtomicUnits by default, or LaserPeriods if required.";
AtomicUnits::usage = "AtomicUnits is a value for the option TimeScale of timeAxis
  which specifies that the times should be in atomic units of time.";
LaserPeriods::usage = "LaserPeriods is a value for the option TimeScale of timeAxis
  which specifies that the times should be in multiples of the carrier laser period.";
Protect[TimeScale, AtomicUnits, LaserPeriods];
Begin["`Private`"];
Options[timeAxis] =
  standardOptions~Join~{TimeScale → AtomicUnits, PointNumberCorrection → 0};
timeAxis::scale =
  "Invalid TimeScale option `1`. Available values are AtomicUnits and LaserPeriods";
timeAxis[OptionsPattern[]] := Block[{T = 2 π / ω, ω = OptionValue[CarrierFrequency],
  num = OptionValue[TotalCycles], npp = OptionValue[PointsPerCycle]},
  Piecewise[{
    {1, OptionValue[TimeScale] === AtomicUnits},
    {1/T, OptionValue[TimeScale] === LaserPeriods}
  },
  Message[timeAxis::scale, OptionValue[TimeScale]]; Abort[]
] × Table[t
  , {t, 0, num  $\frac{2\pi}{\omega}$ ,  $\frac{\text{num}}{\text{num} \times \text{npp} + \text{OptionValue[PointNumberCorrection]}} \frac{2\pi}{\omega}$ }
]
End[];
```

```
tInit = 0;
```

```
tFinal =  $\frac{2\pi}{\omega}$  num;
```

```
δt =  $\frac{\text{tFinal} - \text{tInit}}{\text{num} \times \text{npp} + \text{OptionValue[PointNumberCorrection]}}$ ; (*integration and looping timestep*)
```

## getSpectrum

getSpectrum takes a time-dependent dipole list and returns its Fourier transform in absolute-value-squared. It takes as options

- pulse parameters  $\omega$ , TotalCycles and PointsPerCycle,
- a polarization parameter  $\epsilon$ , which gives an unpolarized spectrum when given False, or polarizes along an ellipticity vector  $\epsilon$  (this is meant primarily to select right- and left-circularly polarized spectra using  $\epsilon = \{1, i\}$  and  $\epsilon = \{1, -i\}$ )

respectively),

- a DifferentiationOrder, which can return the dipole value (default, = 0), velocity (= 1), or acceleration (= 2),
- a power of  $\omega$ ,  $\omega$ Power, with which to multiply the spectrum before returning it (which should be equivalent to DifferentiationOrder except for pathological cases), and
- a ComplexPart function to apply immediately after differentiation (default is the identity function, but Re, Im, or Abs[#]<sup>2</sup> & are reasonable choices).

If no option is passed to  $\omega$ Power and DifferentiationOrder, the pulse parameters do not really affect the output, except by a global factor of TotalCycles.

```
getSpectrum::usage = "getSpectrum[DipoleList] returns the power spectrum of DipoleList.";
Polarization::usage =
  "Polarization is an option for getSpectrum which specifies a polarization
  vector along which to polarize the dipole list. The default,
  Polarization→False, specifies an unpolarized spectrum.";
ComplexPart::usage = "ComplexPart is an option for getSpectrum which
  specifies a function (like Re, Im, or by default #&) which should
  be applied to the dipole list before the spectrum is taken.";
ωPower::usage = "ωPower is an option for getSpectrum which specifies a
  power of frequency which should multiply the spectrum.";
DifferentiationOrder::usage = "DifferentiationOrder is an option for
  getSpectrum which specifies the order to which the dipole
  list should be differentiated before the spectrum is taken.";
Protect[Polarization, ComplexPart, ωPower, DifferentiationOrder];

Begin["`Private`"];
Options[getSpectrum] = {Polarization → False, ComplexPart → (# &),
  ωPower → 0, DifferentiationOrder → 0} ~Join~ standardOptions;

getSpectrum::diffOrd = "Invalid differentiation order `1`.";
getSpectrum::ωPow = "Invalid ω power `1`.";

getSpectrum[dipoleList_, OptionsPattern[]] := Block[
  {polarizationVector, differentiatedList, depth, dimensions,
    num = OptionValue[TotalCycles],
    npp = OptionValue[PointsPerCycle], ω = OptionValue[CarrierFrequency], δt =  $\frac{2\pi/\omega}{npp}$ 
  },
  polarizationVector =  $\frac{\text{OptionValue[Polarization]}}{\text{Norm[OptionValue[Polarization]}}$ ;

  differentiatedList = OptionValue[ComplexPart][Piecewise[{
    {dipoleList, OptionValue[DifferentiationOrder] == 0},
    { $\frac{1}{2\delta t}$  (Most[Most[dipoleList]] - Rest[Rest[dipoleList]]),
      OptionValue[DifferentiationOrder] == 1},
    { $\frac{1}{\delta t^2}$  (Most[Most[dipoleList]] - 2 Most[Rest[dipoleList]] + Rest[Rest[dipoleList]]),
      OptionValue[DifferentiationOrder] == 2}}],
```

```

    Message[getSpectrum::diffOrd, OptionValue[DifferentiationOrder]];
    Abort[]
  ]];

If[NumberQ[OptionValue[ωPower]], Null;; Message[getSpectrum::ωPow, OptionValue[ωPower]];
  Abort[] ];

num Table[
  ( $\frac{\omega}{\text{num}} k$ )2 OptionValue[ωPower], {k, 1, Round[ $\frac{\text{Length}[\text{differentiatedList}]}{2}$ ]}
] × If[
  OptionValue[Polarization] === False, (*unpolarized spectrum*)
  (*funky depth thing so this can take lists of numbers and lists of vectors,
  of arbitrary length. Makes for easier benchmarking.*)
  depth = Length[Dimensions[dipoleList]];
  dimensions = If[Length[#] > 1, #[[2]], 1(*#[[1]]*)] &[Dimensions[dipoleList]];

    Fourier[
      If[depth > 1, Re[differentiatedList[[All, i]]], Re[differentiatedList[[All]]]]
      , FourierParameters → {-1, 1}
    ] [[1 ;; Round[ $\frac{\text{Length}[\text{differentiatedList}]}{2}$ ]]]]
  ]2, {i, 1, dimensions}]
, (*polarized spectrum*)
Abs[
  Transpose[Table[
    Fourier[
      Re[differentiatedList[[All, i]]]
      , FourierParameters → {-1, 1}
    ]
    , {i, 1, 2}]] [[1 ;; Round[Length[differentiatedList]/2]]].polarizationVector
  ]2
]
End[];

```

## spectrumPlotter

spectrumPlotter takes a spectrum and a list of options and returns a plot of the spectrum. The available options are

- a FrequencyAxis option, which will give the harmonic order as a horizontal axis by default, and an arbitrary scale with any other option,
- all the options of harmonicOrderAxis, which will be passed to the call that makes the horizontal axis, and
- all the options of ListLinePlot, which will be used to format the plot.

```

spectrumPlotter::usage = "spectrumPlotter[spectrum]
  plots the given spectrum with an appropriate axis in a log10 scale.";
FrequencyAxis::usage = "FrequencyAxis is an option for spectrumPlotter

```

## biColorSpectrum

biColorSpectrum takes a time-dependent dipole list and produces overlaid plots of the right- and left-circular components of the spectrum, in red and blue respectively. It takes all the options of getSpectrum and spectrumPlotter, which are passed directly to the corresponding calls, as well as the options of Show, which can be used to modify the plot appearance.

Quit

```

biColorSpectrum::usage =
  "biColorSpectrum[DipoleList] produces a two-colour spectrum of DipoleList,
    separating the two circular polarizations.";
Begin["`Private`"];
Options[biColorSpectrum] = Join[{PlotRange → All}, Options[Show],
  Options[spectrumPlotter], DeleteCases[Options[getSpectrum], Polarization → False]];
biColorSpectrum[dipoleList_, options : OptionsPattern[]] := Show[{
  spectrumPlotter[
    getSpectrum[dipoleList, Polarization → {1, +1},
      Sequence@@FilterRules[{options}, Options[getSpectrum]]],
    PlotStyle → Red, Sequence@@FilterRules[{options}, Options[spectrumPlotter]]],
  spectrumPlotter[
    getSpectrum[dipoleList, Polarization → {1, -1},
      Sequence@@FilterRules[{options}, Options[getSpectrum]]],
    PlotStyle → Blue, Sequence@@FilterRules[{options}, Options[spectrumPlotter]]]
  },
  PlotRange → OptionValue[PlotRange],
  Sequence@@FilterRules[{options}, Options[Show]]
]
End[];

```

## Various gate functions

Gate functions are used to suppress the contributions of extra-long trajectories with long excursion times, partly to reflect the effect of phase matching but mostly to keep integration times reasonable. They are provided to the main numerical integrator `makeDipoleList` via its `Gate` option.

```

SineSquaredGate::usage =
  "SineSquaredGate[nGateRamp] specifies an integration gate with a sine-squared
    ramp, such that SineSquaredGate[nGateRamp][ωt,nGate]
    has nGate flat periods and nGateRamp ramp periods.";
LinearRampGate::usage = "LinearRampGate[nGateRamp] specifies an integration
  gate with a linear ramp, such that SineSquaredGate[nGateRamp][ωt,nGate]
  has nGate flat periods and nGateRamp ramp periods.";
Begin["`Private`"];
SineSquaredGate[nGateRamp_][ωτ_, nGate_] := Piecewise[{{1, ωτ ≤ 2 π (nGate - nGateRamp)},
  {Sin[ $\frac{2 \pi nGate - \omega \tau}{4 nGateRamp}$ ]2, 2 π (nGate - nGateRamp) < ωτ ≤ 2 π nGate}, {0, nGate < ωτ}}]
LinearRampGate[nGateRamp_][ωτ_, nGate_] := Piecewise[{{1, ωτ ≤ 2 π (nGate - nGateRamp)},
  {- $\frac{\omega \tau - 2 \pi (nGate + nGateRamp)}{2 \pi nGateRamp}$ , 2 π (nGate - nGateRamp) < ωτ ≤ 2 π nGate}, {0, nGate < ωτ}}]
End[];

```

## getIonizationPotential

```

getIonizationPotential::usage =
  "getIonizationPotential[Target] returns the ionization potential
    of an atomic target, e.g. \"Hydrogen\", in atomic units.

getIonizationPotential[Target,q] returns the ionization
  potential of the q-th ion of the specified Target, in atomic units.

getIonizationPotential[{Target,q}] returns the ionization
  potential of the q-th ion of the specified Target, in atomic units.";
Begin["`Private`"];
getIonizationPotential[Target_, Charge_: 0] :=
  UnitConvert[ElementData[Target, "IonizationEnergies"][[Charge + 1]] /
    (Quantity[1, "AvogadroConstant"] Quantity[1, "Hartrees"])]
getIonizationPotential[{Target_, Charge_: 0}] := getIonizationPotential[Target, Charge]
End[];

```

## makeDipoleList: main numerical integrator

The main integration function is `makeDipoleList`, and its basic syntax is of the form `makeDipoleList[VectorPotential→A]`. Here the vector potential `A` must be a function object, such that for numeric `t` the construct `A[t]` returns a list of numbers after the appropriate field parameters have been introduced: thus the criterion is that, for a call of the form `makeDipoleList[VectorPotential→A, FieldParameters→pars]`, a call of the form `A[t]//.pars` returns a list of numbers for numeric `t`. To see the available options use `Options[makeDipoleList]`, and to get information on each option use the `?VectorPotential` construct.

```

makeDipoleList::usage = "makeDipoleList[VectorPotential→A]
  calculates the dipole response to the vector potential A.";

VectorPotential::usage =
  "VectorPotential is an option for makeDipole list which specifies the field's vector
  potential. Usage should be VectorPotential→A, where A[t]//.pars must yield a
  list of numbers for numeric t and parameters indicated by FieldParameters→pars.";
VectorPotentialGradient::usage = "VectorPotentialGradient is an option for makeDipole
  list which specifies the gradient of the field's vector potential. Usage should be
  VectorPotentialGradient→GA, where GA[t]//.pars must yield a square matrix of the
  same dimension as the vector potential for numeric t and parameters indicated by
  FieldParameters→pars. The indices must be such that GA[t][[i,j]] returns  $\partial_i A_j[t]$ .";
ElectricField::usage = "ElectricField is an option for makeDipole list which
  specifies an electric field to use in the ionization matrix element,
  in case the time derivative of the vector potential is not desired.
  Usage should be ElectricField→F, where F[t]//.pars must yield a list of
  numbers for numeric t and parameters indicated by FieldParameters→pars.";
FieldParameters::usage = "FieldParameters is an option for makeDipole list which ";
Preintegrals::usage =
  "Preintegrals is an option for makeDipole list which specifies whether the

```

```

preintegrals of the vector potential should be \"Analytic\" or \"Numeric\".";
ReportingFunction::usage = "ReportingFunction is an option for makeDipole
list which specifies a function used to report the results, either
internally (by the default, Identity) or to an external file.";
Gate::usage = "Gate is an option for makeDipole list which specifies the
integration gate to use. Usage as Gate→g, nGate→n will gate the integral
at time  $\omega t/\omega$  by  $g[\omega t, n]$ . The default is Gate→SineSquaredGate[1/2].";
nGate::usage = "nGate is an option for makeDipole list which specifies
the total number of cycles in the integration gate.";
IonizationPotential::usage = "IonizationPotential is an option for makeDipoleList
which specifies the ionization potential  $I_p$  of the target.";
Target::usage = "Target is an option for makeDipoleList which specifies
chemical species producing the HHG emission, pulling the ionization
potential from the Wolfram ElementData curated data set.";
DipoleTransitionMatrixElement::usage = "DipoleTransitionMatrixElement is an option
for makeDipoleList which specifies a function f to use as the dipole transition
matrix element, or a pair of functions {fion, frec} to be used separately for the
ionization and recombination dipoels, to be used in the form  $f[p, \kappa] = f[p, \sqrt{2 I_p}]$ .";
eCorrection::usage = "eCorrection is an option for makeDipoleList which specifies
the regularization correction  $\epsilon$ , i.e. as used in the factor  $\frac{1}{(t - t_t + i\epsilon)^{3/2}}$ .";
PointNumberCorrection::usage = "PointNumberCorrection is an option for
makeDipoleList and timeAxis which specifies an extra number of points
to be integrated over, which is useful to prevent Indeterminate errors
when a Piecewise envelope is being differentiated at the boundaries.";
IntegrationPointsPerCycle::usage = "IntegrationPointsPerCycle is an option for
makeDipoleList which controls the number of points per cycle to use for the
integration. Set to Automatic, to follow PointsPerCycle, or to an integer.";
RunInParallel::usage = "RunInParallel is an option for makeDipoleList which
controls whether each RB-SFA instance is parallelized. It accepts False
as the (Automatic) option, True, to parallelize each instance, or a pair
of functions {TableCommand, SumCommand} to use for the iteration and
summing, which could be e.g. {Inactive[ParallelTable], Inactive[Sum]}.";
Simplifier::usage = "Simplifier is an option for makeDipoleList which specifies a
function to use to simplify the intermediate and final analytical results.";
CheckNumericFields::usage = "CheckNumericFields is an option for makeDipoleList which
specifies whether to check for numeric values of A[t] and GA[t] for numeric t.";
QuadraticActionTerms::usage = "QuadraticActionTerms is an option for makeDipoleList
which specifies whether to use quadratic terms in  $\nabla A^2$  in the action.";

## Quantum orbit functions suite

### Complex root finder

This section implements a routine for solving contains subroutines for the numerical solution of multiple simultaneous complex-valued transcendental equations, essentially by using the Newton's-method solver implemented in FindRoot, and seeding it multiple times with a random (or quasi-random) seed from a box. This code has been taken from the EPTtoolbox package, which is located and better documented at <https://github.com/episanty/EPTtoolbox>, and it is also documented in <http://mathematica.stackexchange.com/a/57821/1000>.

```

FindComplexRoots::usage =
  "FindComplexRoots[e1==e2, {z, zmin, zmax}] attempts to find complex roots of
  the equation e1==e2 in the complex rectangle with corners zmin and zmax.

FindComplexRoots[{e1==e2, e3==e4, ...}, {z1, z1min, z1max}, {z2, z2min, z2max}, ...]
  attempts to find complex roots of the given system of equations in the
  multidimensional complex rectangle with corners z1min, z1max, z2min, z2max, ...";
Seeds::usage = "Seeds is an option for FindComplexRoots which determines how many
  initial seeds are used to attempt to find roots of the given equation.";
SeedGenerator::usage = "SeedGenerator is an option for FindComplexRoots which determines
  the function used to generate the seeds for the internal FindRoot call. Its
  value can be RandomComplex, RandomNiederreiterComplexes, RandomSobolComplexes,
  DeterministicComplexGrid, or any function f such that f[{zmin, zmax}, n]
  returns n complex numbers in the rectangle with corners zmin and zmax.";

## Quasirandom number generators

This section implements quasirandom number generators for use with FindComplexRoots. As above, this code has been taken from the EPTtoolbox package, which is located and better documented at <https://github.com/episanty/EP-Toolbox>, and it is also documented in <http://mathematica.stackexchange.com/a/57821/1000>.

## RandomSobolComplexes

**RandomSobolComplexes::usage =**  
 "RandomSobolComplexes[{zmin, zmax}, n] generates a low-discrepancy Sobol sequence of n quasirandom complex numbers in the rectangle with corners zmin and zmax.  
 RandomSobolComplexes[{{z1min,z1max},{z2min,z2max},...},n] generates a low-discrepancy Sobol sequence of n quasirandom complex numbers in the multi-dimensional rectangle with corners {z1min,z1max},{z2min,z2max},....";

```

## RandomComplex

Updating RandomComplex to handle input of the form RandomComplex[{{0, 1+i}, {2, 3+i}}, n].

```

Begin["`Private`"];
Unprotect[RandomComplex];
RandomComplex[{range1_List, moreRanges___}, number_] :=
  Transpose[RandomComplex[#, number] & /@ {range1, moreRanges}]
Protect[RandomComplex];
End[];

```

The following code places this redefinition as an initialization code for any parallelized subkernels that may get launched later (cf. [mm.se/q/131856](http://mm.se/q/131856)). This version, in addition, checks whether there is already any code in \$InitCode and, if there is, it appends its own code there.

```

Parallelize;
If[Head[Parallel`Developer`$InitCode] != Hold,
  Parallel`Developer`$InitCode = Hold[]
];
Parallel`Developer`$InitCode = Join[
  Parallel`Developer`$InitCode,
  Hold[
    Unprotect[RandomComplex];
    RandomComplex[{Private`range1_List, Private`moreRanges___}, Private`number_] :=
      Transpose[RandomComplex[#, Private`number] & /@ {Private`range1, Private`moreRanges}];
    Protect[RandomComplex];
  ]
];

```

## GetSaddlePoints

**GetSaddlePoints::usage =**

"GetSaddlePoints[ $\Omega$ , S, {tmin, tmax}, { $\tau$ min,  $\tau$ max}] finds a list of solutions {t,  $\tau$ } of the HHG temporal saddle-point equations at harmonic energy  $\Omega$  for action S, in the range {tmin, tmax} of recombination time and { $\tau$ min,  $\tau$ max} of excursion time, where both ranges should be the lower-left and upper-right corners of rectangles in the complex plane.

GetSaddlePoints[ $\Omega$ Range, S, {tmin, tmax}, { $\tau$ min,  $\tau$ max}] finds solutions of the HHG temporal saddle-point equations for a range of harmonic energies  $\Omega$ Range, and returns an Association with each harmonic energy  $\Omega$  indexing a list of saddle-point solution pairs {t,  $\tau$ }.

GetSaddlePoints[ $\Omega$ spec, S, {{tmin<sub>1</sub>, tmax<sub>1</sub>}, { $\tau$ min<sub>1</sub>,  $\tau$ max<sub>1</sub>}}, {{tmin<sub>2</sub>, tmax<sub>2</sub>}, { $\tau$ min<sub>2</sub>,  $\tau$ max<sub>2</sub>}}, ...] uses multiple time domains and combines the solutions.

GetSaddlePoints[ $\Omega$ spec, S, {{urange, vrangle}, ...}, IndependentVariables→{u, v}] uses the explicit independent variables u and v to solve the equations and over the given ranges, where u and v can be any of "RecombinationTime", "IonizationTime" and "ExcursionTime", or their shorthands "t", "tt" and " $\tau$ " resp.;

SortingFunction::usage = "SortingFunction is an option of GetSaddlePoints which sets a function f, to be used as f[t,  $\tau$ , S,  $\Omega$ ], to be used to sort the solutions, or a list of such functions.";

SelectionFunction::usage = "SelectionFunction is an option of GetSaddlePoints that sets a function f, to be used as f[t,  $\tau$ , S,  $\Omega$ ], such that roots are only kept if f returns True.";
